

## PROMAX 20

Descaling pump with flow inverter

Due to the increase of temperature, calcium salts present in the water precipitate and they are deposited on metal surfaces of pipes, coils and heat exchanger systems, resulting in decreased flow and thermal performance. To avoid the situation above mentioned and to restore the normal condition it is necessary to proceed with a descaling with the right equipment. The PROMAX 20 is a vertical axis pump suitable for these purposes (coils boilers and heat exchangers). Its adaptability, flexibility, ease of use and high performance make this product the most sought after by the technicians.
